

Multithreading and Vectorization on Intel® Xeon™ and Intel® Xeon Phi™ architectures using OpenMP

Silvio Stanzani , Raphael Cobe , Rogério Iope

UNESP - Núcleo de Computação Científica

silvio@ncc.unesp.br , rmcobe@ncc.unesp.br , rogerio@ncc.unesp.br

VECPAR 2016
12th International Meeting on
High Performance Computing for Computational Science

Agenda

- NCC/UNESP Presentation
- Parallel Architectures
- Intel Xeon and Intel Xeon Phi
- OpenMP
- Thread Affinity
- Vectorization
- Offloading
- Thread League
- N-body Simulation

Reference Material

- **Source-code, slides and book chapter (in Portuguese):**

[https://github.com/intel-unesp-mcp/talks-source-code/
tree/master/OpenMP4](https://github.com/intel-unesp-mcp/talks-source-code/tree/master/OpenMP4)

UNESP Center for Scientific Computing

- Consolidates scientific computing resources for São Paulo State University (UNESP) researchers
 - It mainly uses Grid computing paradigm
- Main users
 - UNESP researchers, students, and software developers
 - SPRACE (São Paulo Research and Analysis Center) physicists and students
 - ❑ Caltech, Fermilab, CERN
 - ❑ São Paulo CMS Tier-2 Facility

UNESP Center for Scientific Computing

SPRACE - LHC/CMS Tier2 Facility

- 96 worker nodes
 - Physical CPUs: 128
 - Logical CPUs (cores): 1152
 - HEPSpec06: 17456
 - 128 cores: 3GB/core
 - 1024 cores: 4GB/core
- 02 head nodes
- 13 storage servers
 - 1 PB (effective)
- Network
 - LAN: 1 Gbps & 10 Gbps
 - WAN: 2x 10 Gbps , 2x 40 Gbps (1x 100G in Q3 2016)

GridUnesp - HPC infrastructure

- Campus Grid
 - 1 central cluster + 6 secondary clusters (deployed in different Unesp campi at São Paulo State)
- Worker nodes @ NCC
 - Physical CPUs: 256 (2009)
 - Logical CPUs (cores): 2048 - 2GB/core
- 1 head node
- 1 storage server
 - 132 TB (effective)
- Network
 - LAN: 1 Gbps
 - WAN: 2x 10 Gbps

Unesp / Intel Collaborative Efforts

- IPCC (Intel Parallel Computing Center)
 - Vectorization & Parallelization of Geant (GEometry ANd Tracking)

- Intel Modern Code
 - Workshops and Tutorials
 - High Performance Computing (HPC)
 - Data Science / Big Data Analytics
 - HPC Consultancy

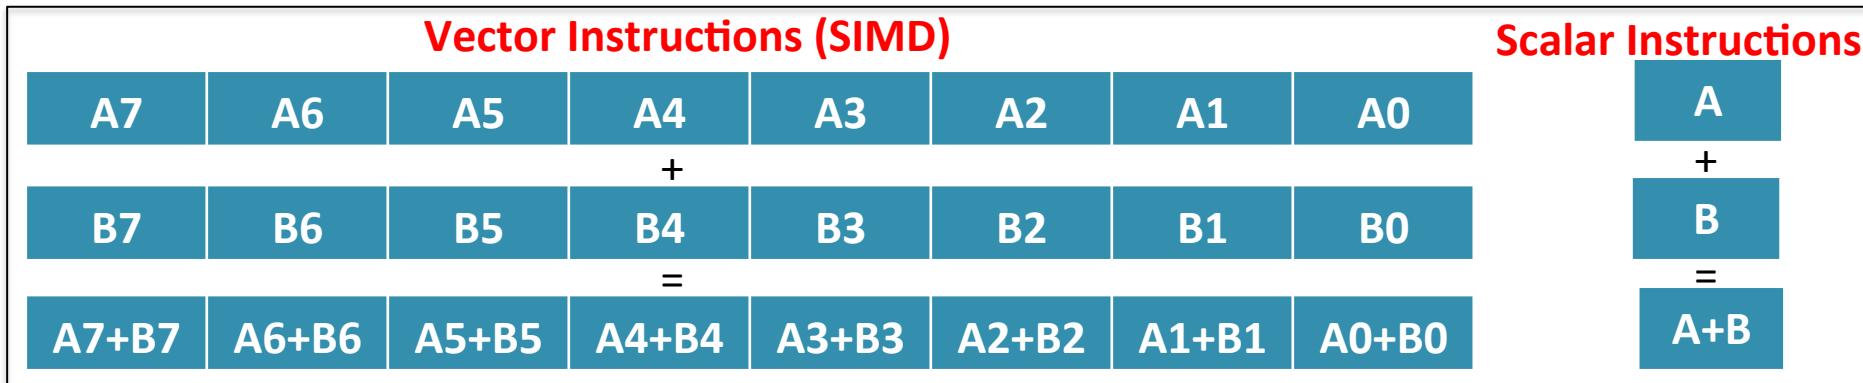

Agenda

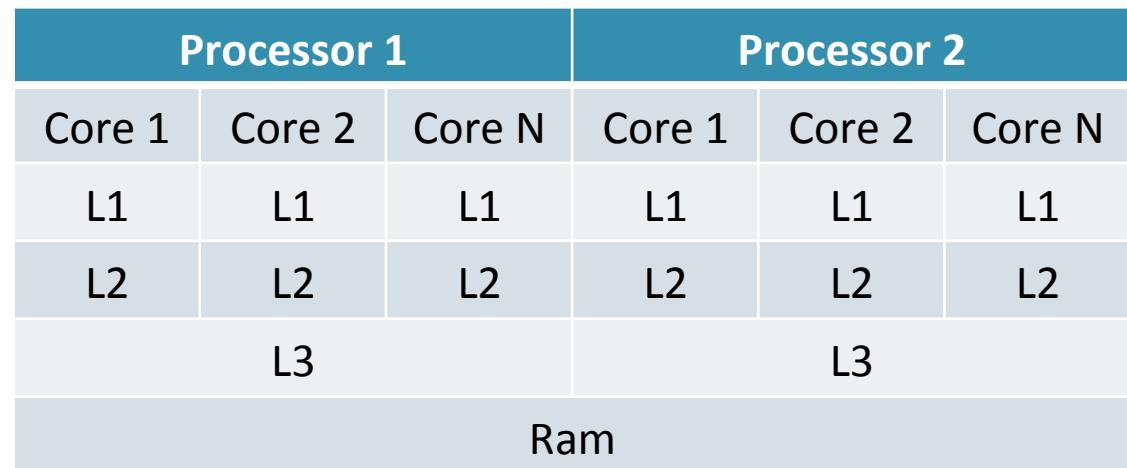

- NCC Presentation
- Parallel Architectures
- Intel Xeon and Intel Xeon Phi
- OpenMP
- Thread Affinity
- Vectorization
- Offloading
- Thread League
- N-body Simulation

Parallel Architectures

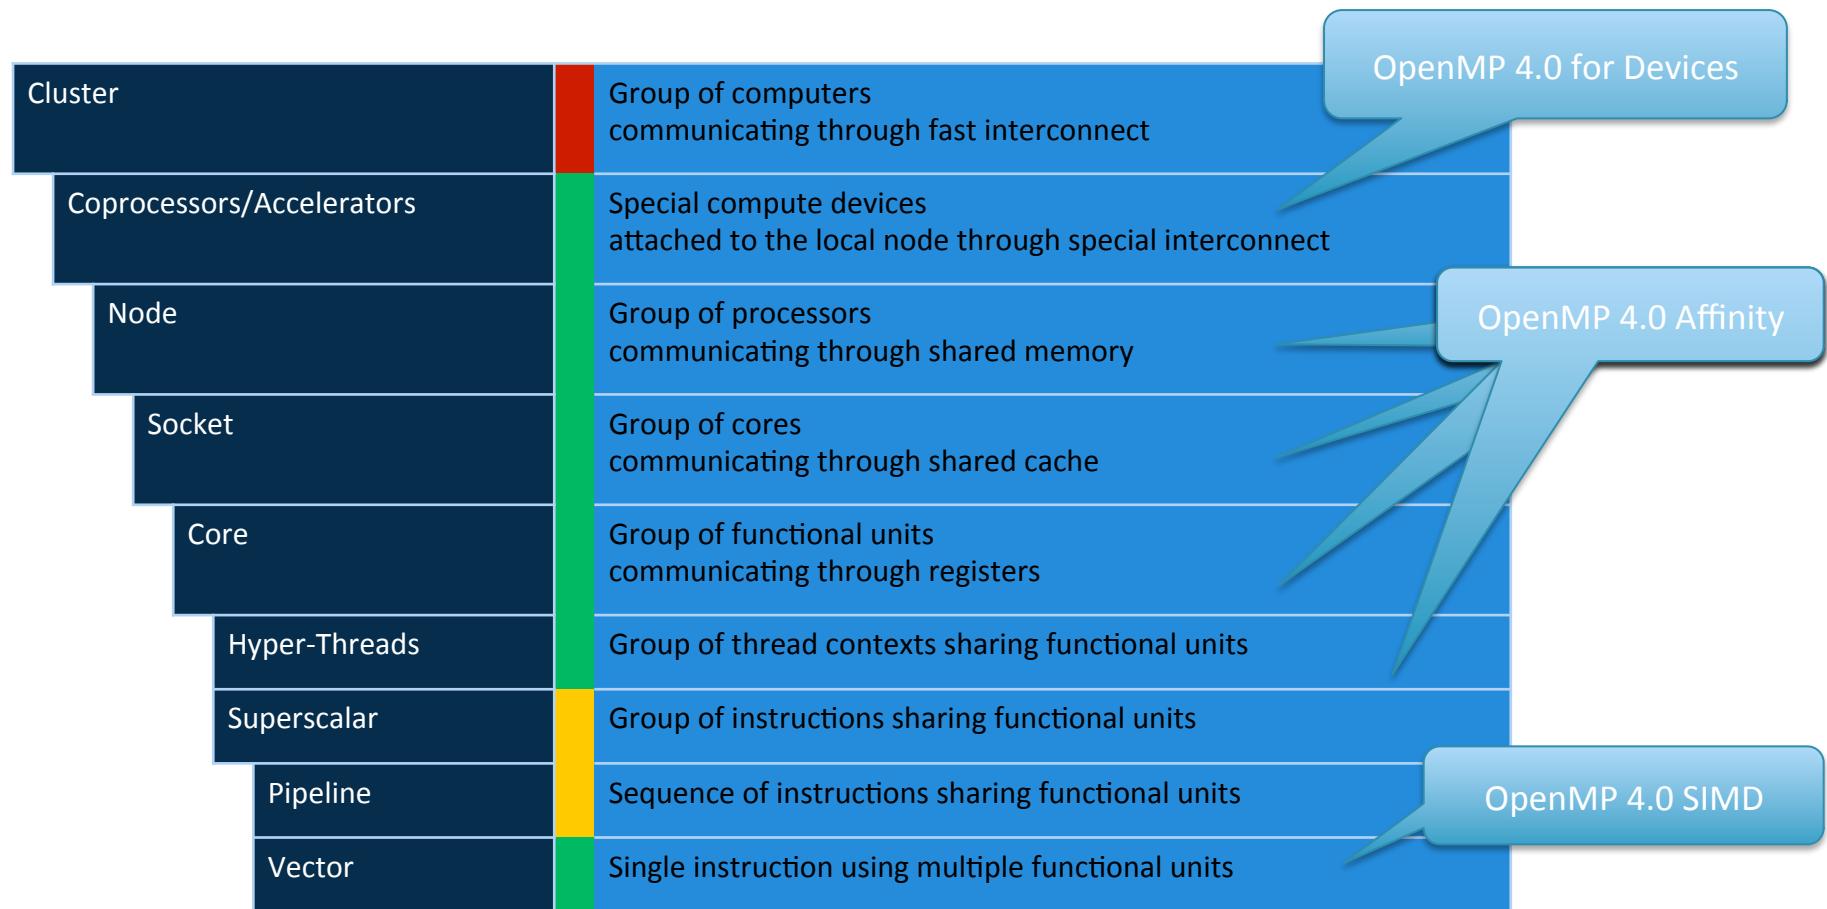

- Heterogeneous computational systems:
 - Multicore processors

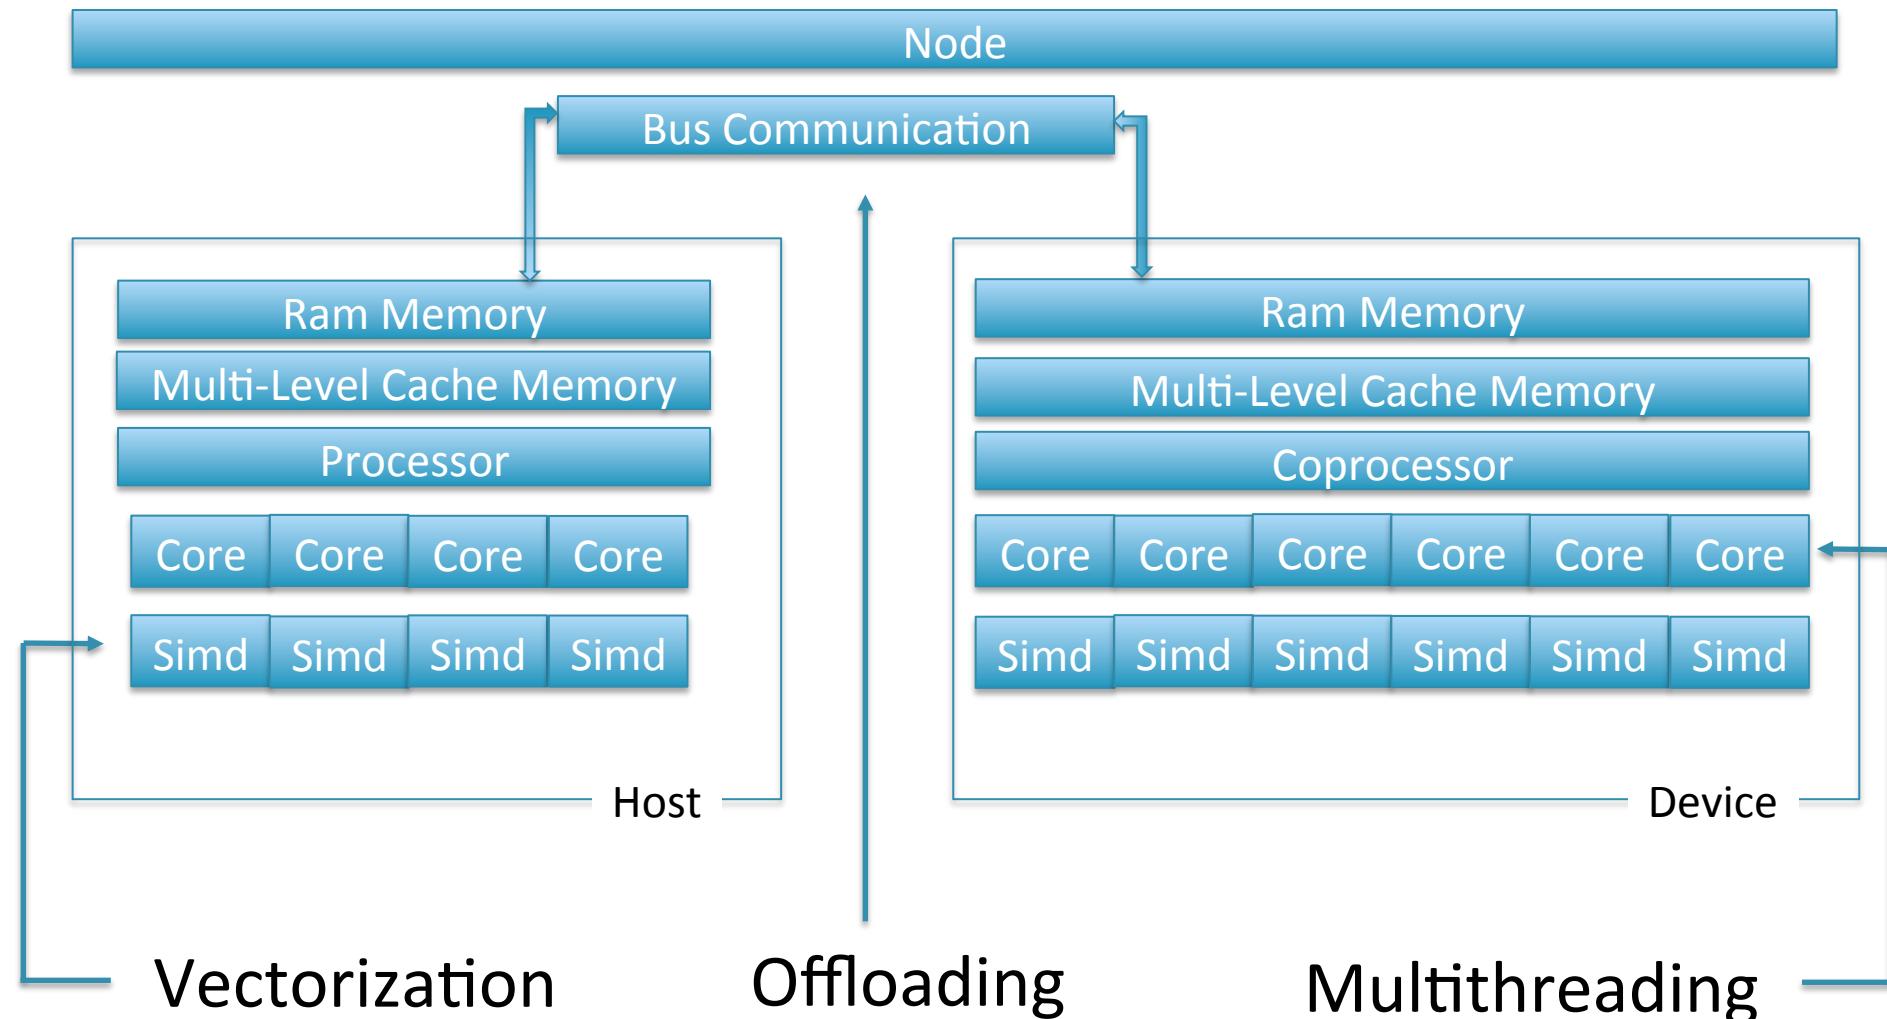

- Multi-level memory
 - Ram Memory;
 - Multi-level Cache.

Multi Level Parallelism

Hybrid Parallel Architectures

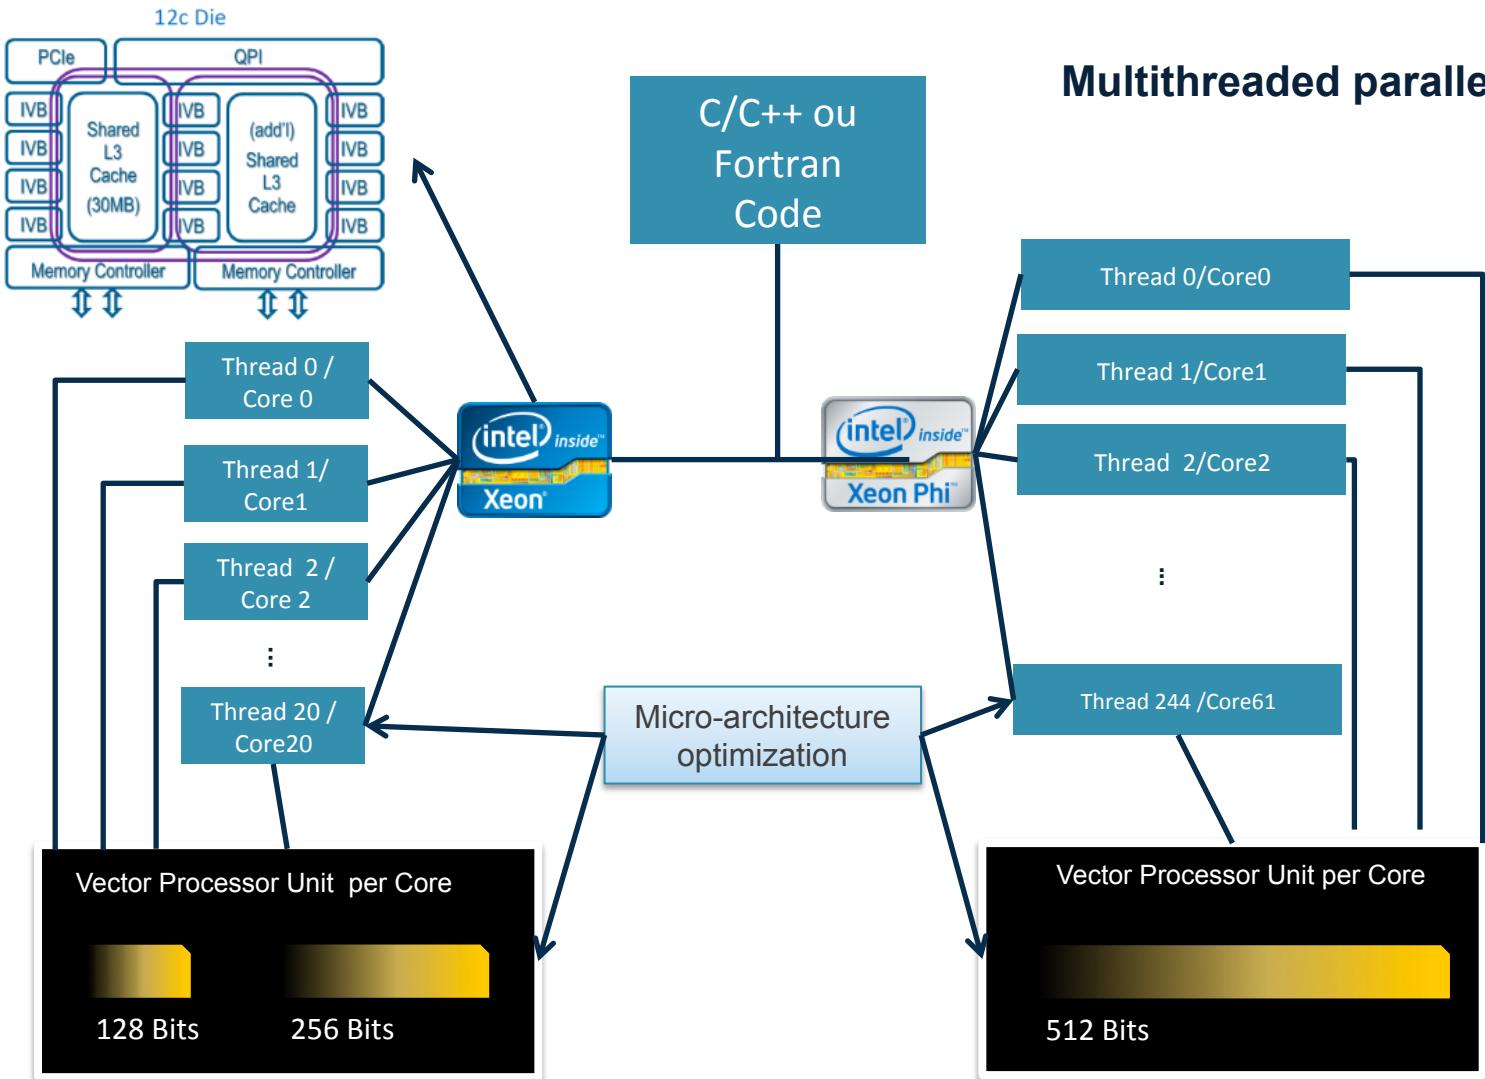

Hybrid Parallel Architectures

- Exploring parallelism in hybrid parallel architectures
 - Multithreading
 - Vectorization
 - Auto vectorization
 - Semi-auto vectorization
 - Explicit vectorization
 - Offloading
 - Offloading code to device
- OpenMP 4.0
 - Supports vectorization and offloading on hybrid parallel architectures

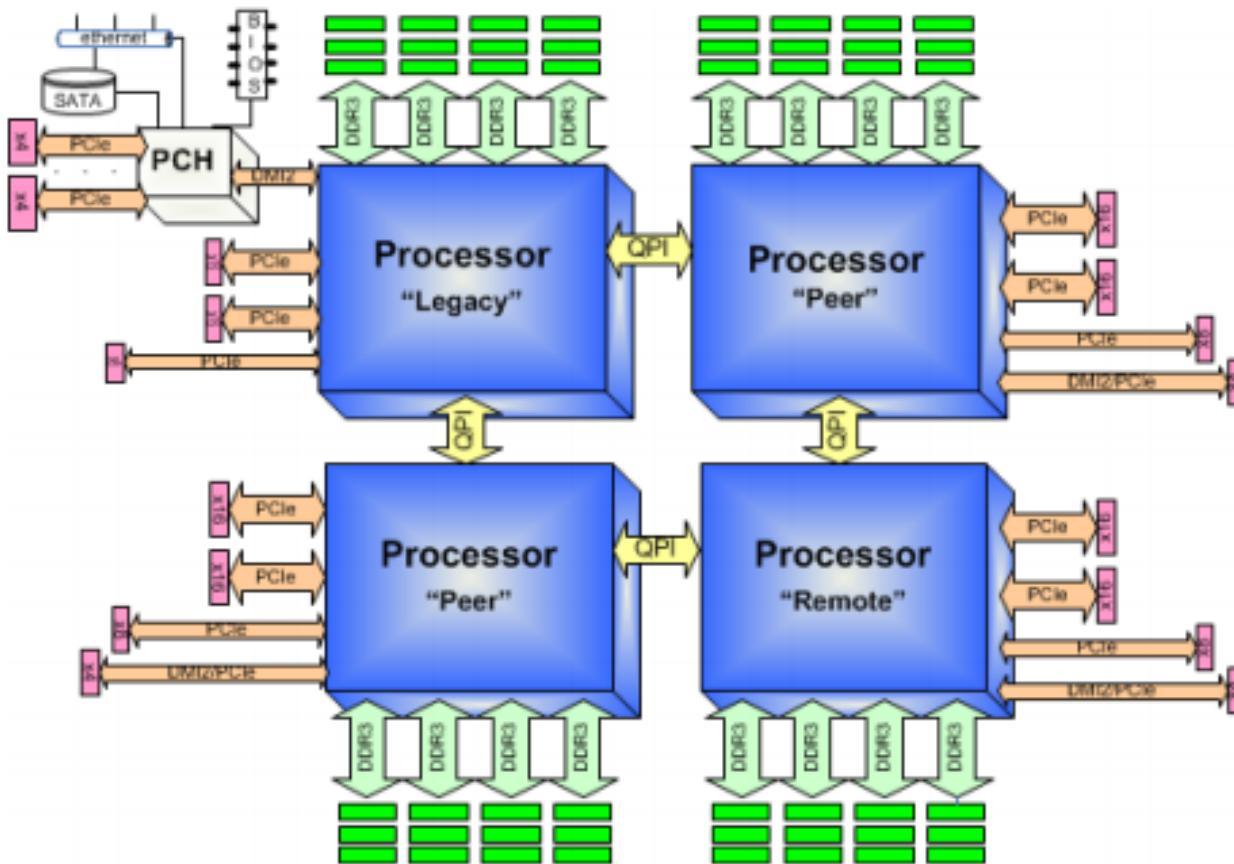

Agenda

- NCC Presentation
- Parallel Architectures
- Intel Xeon and Intel Xeon Phi
- OpenMP
- Thread Affinity
- Vectorization
- Offloading
- Thread League
- N-body Simulation

Data Level Parallelism via SIMD

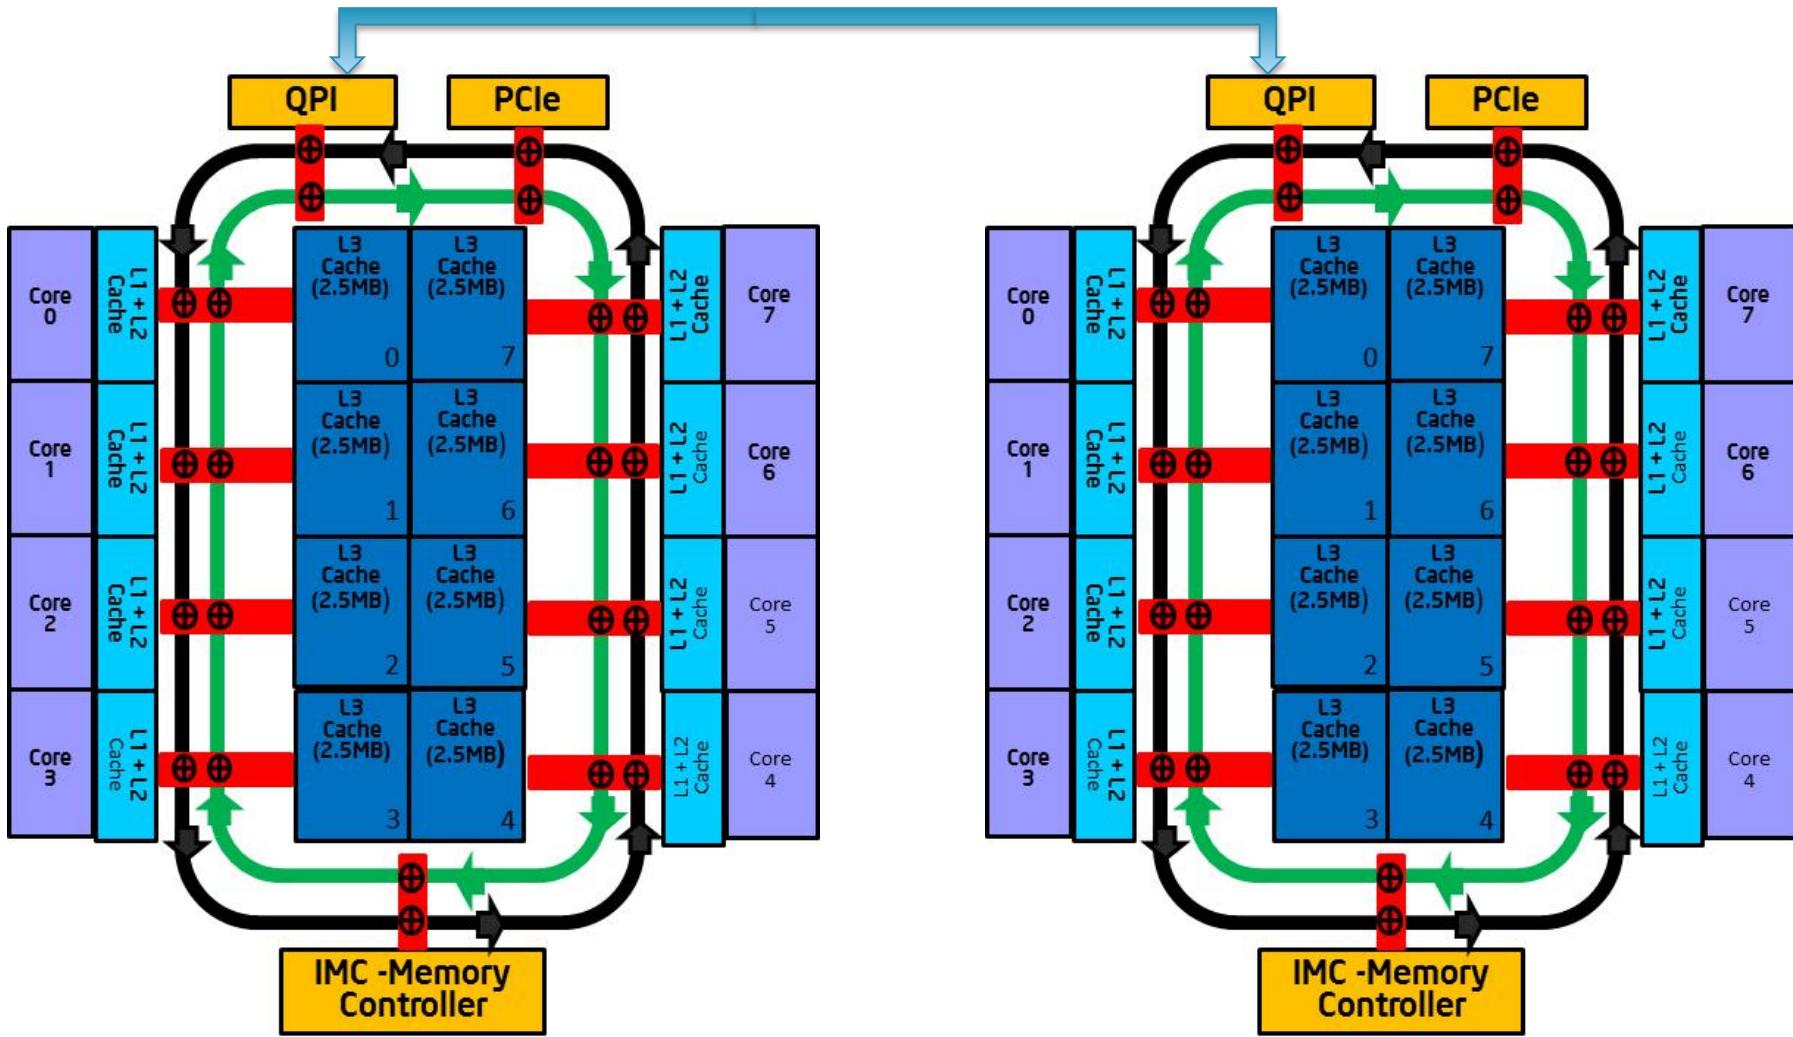

Intel Xeon Architecture Overview

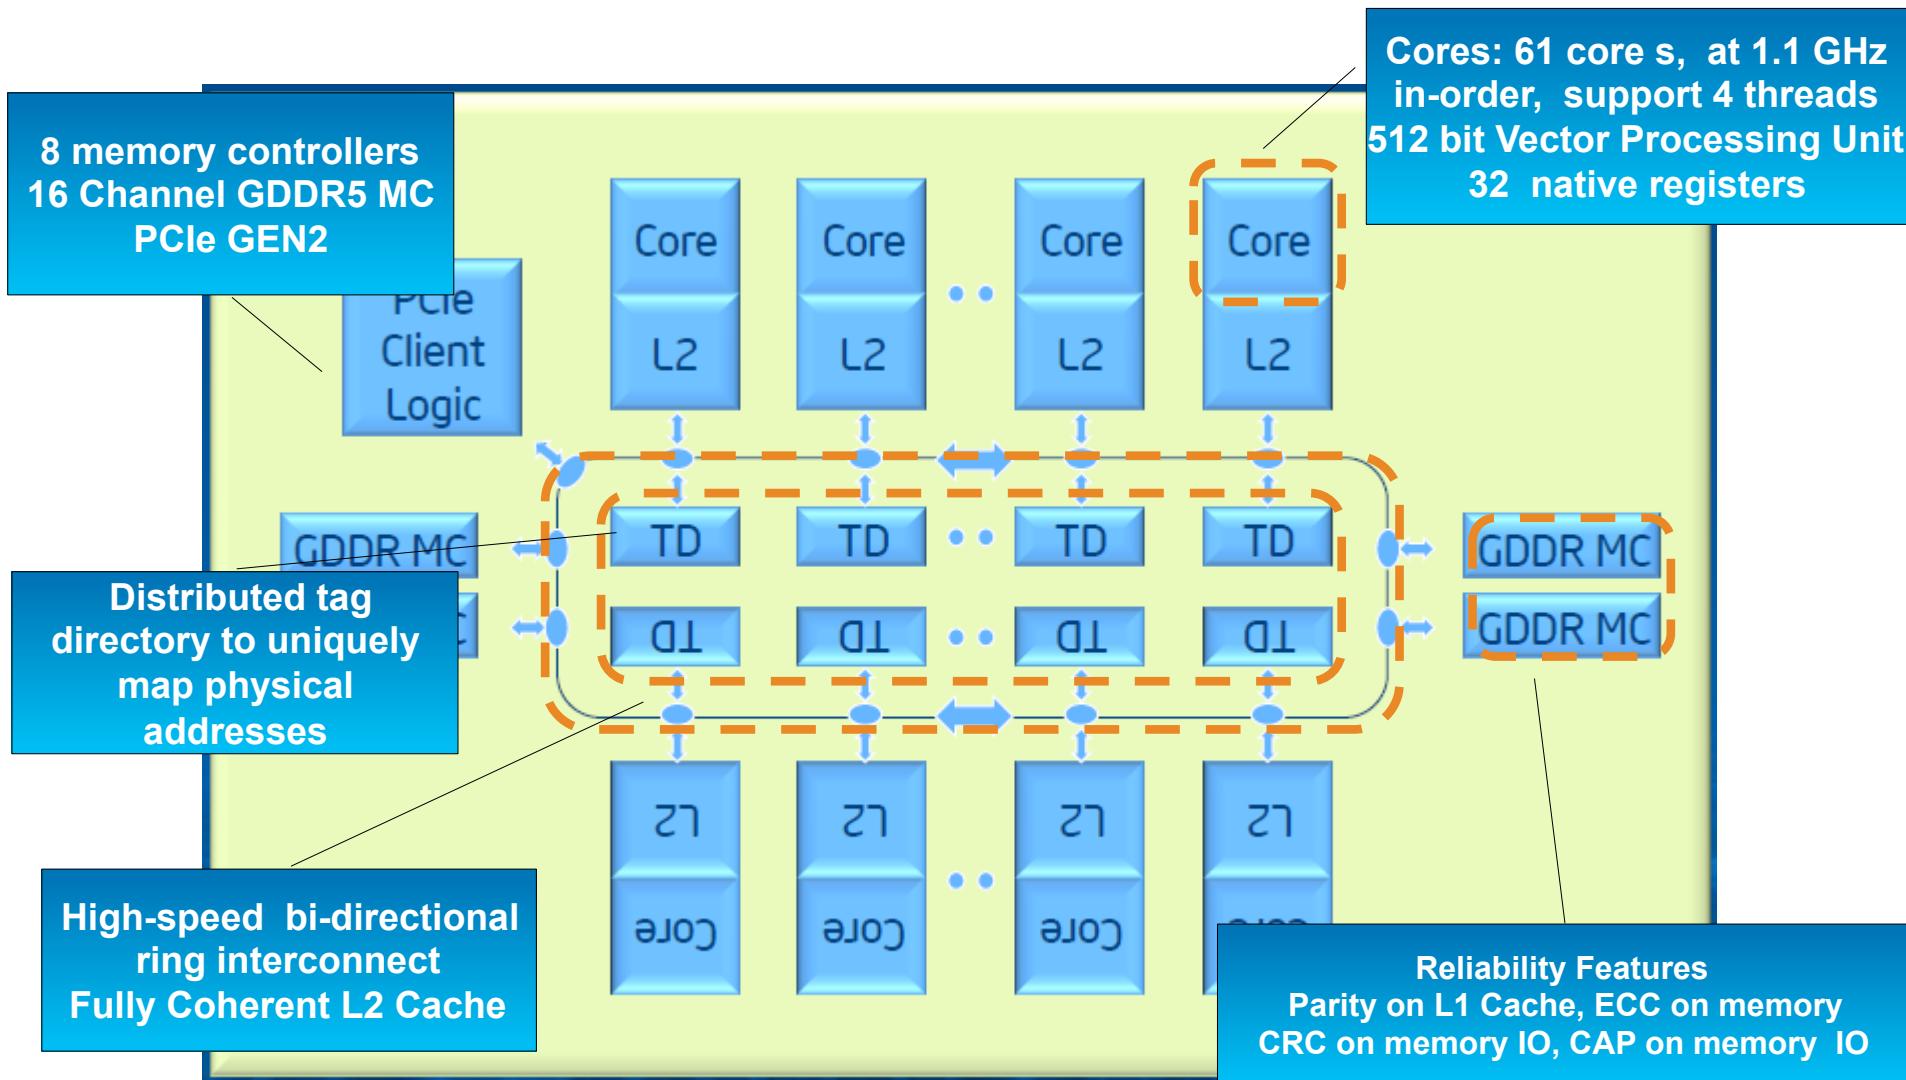

Intel Xeon Architecture Overview

- Socket: mechanical component that provides mechanical and electrical connections between a microprocessor and a printed circuit board (PCB).
- QPI (Intel QuickPath Interconnect): high speed, packetized, point-to-point interconnection, that stitch together processors in distributed shared memory and integrated I/O platform architecture.

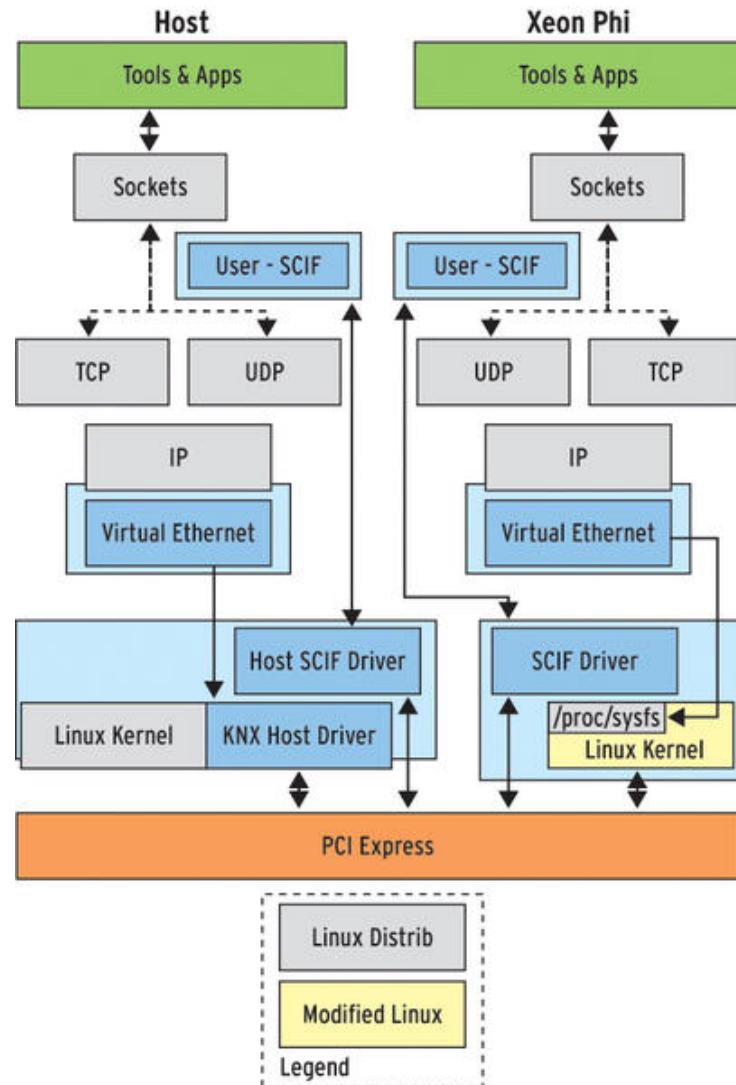

Intel® Xeon Architecture Overview

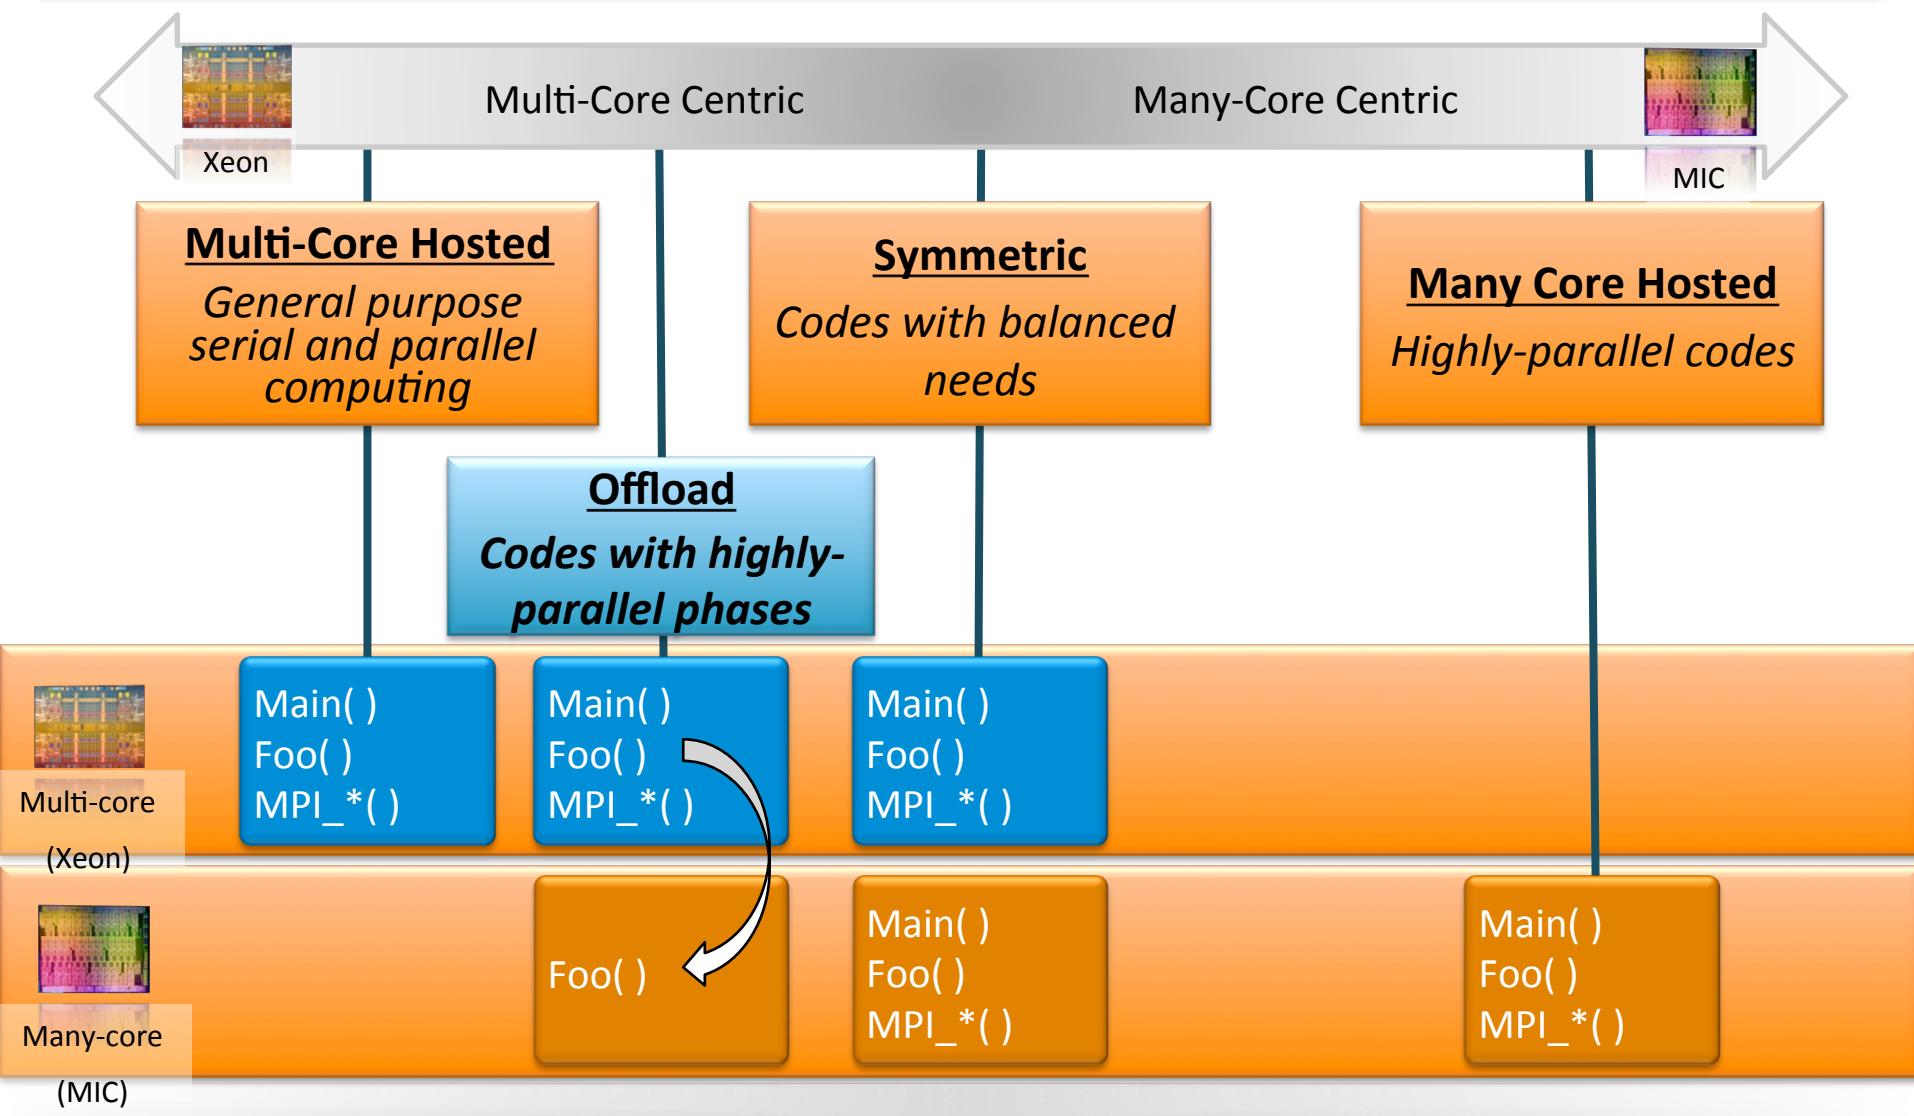

Intel® Xeon Phi™ Architecture Overview

Intel® Xeon and Intel® Xeon Phi™

Programming Models

Range of models to meet application needs

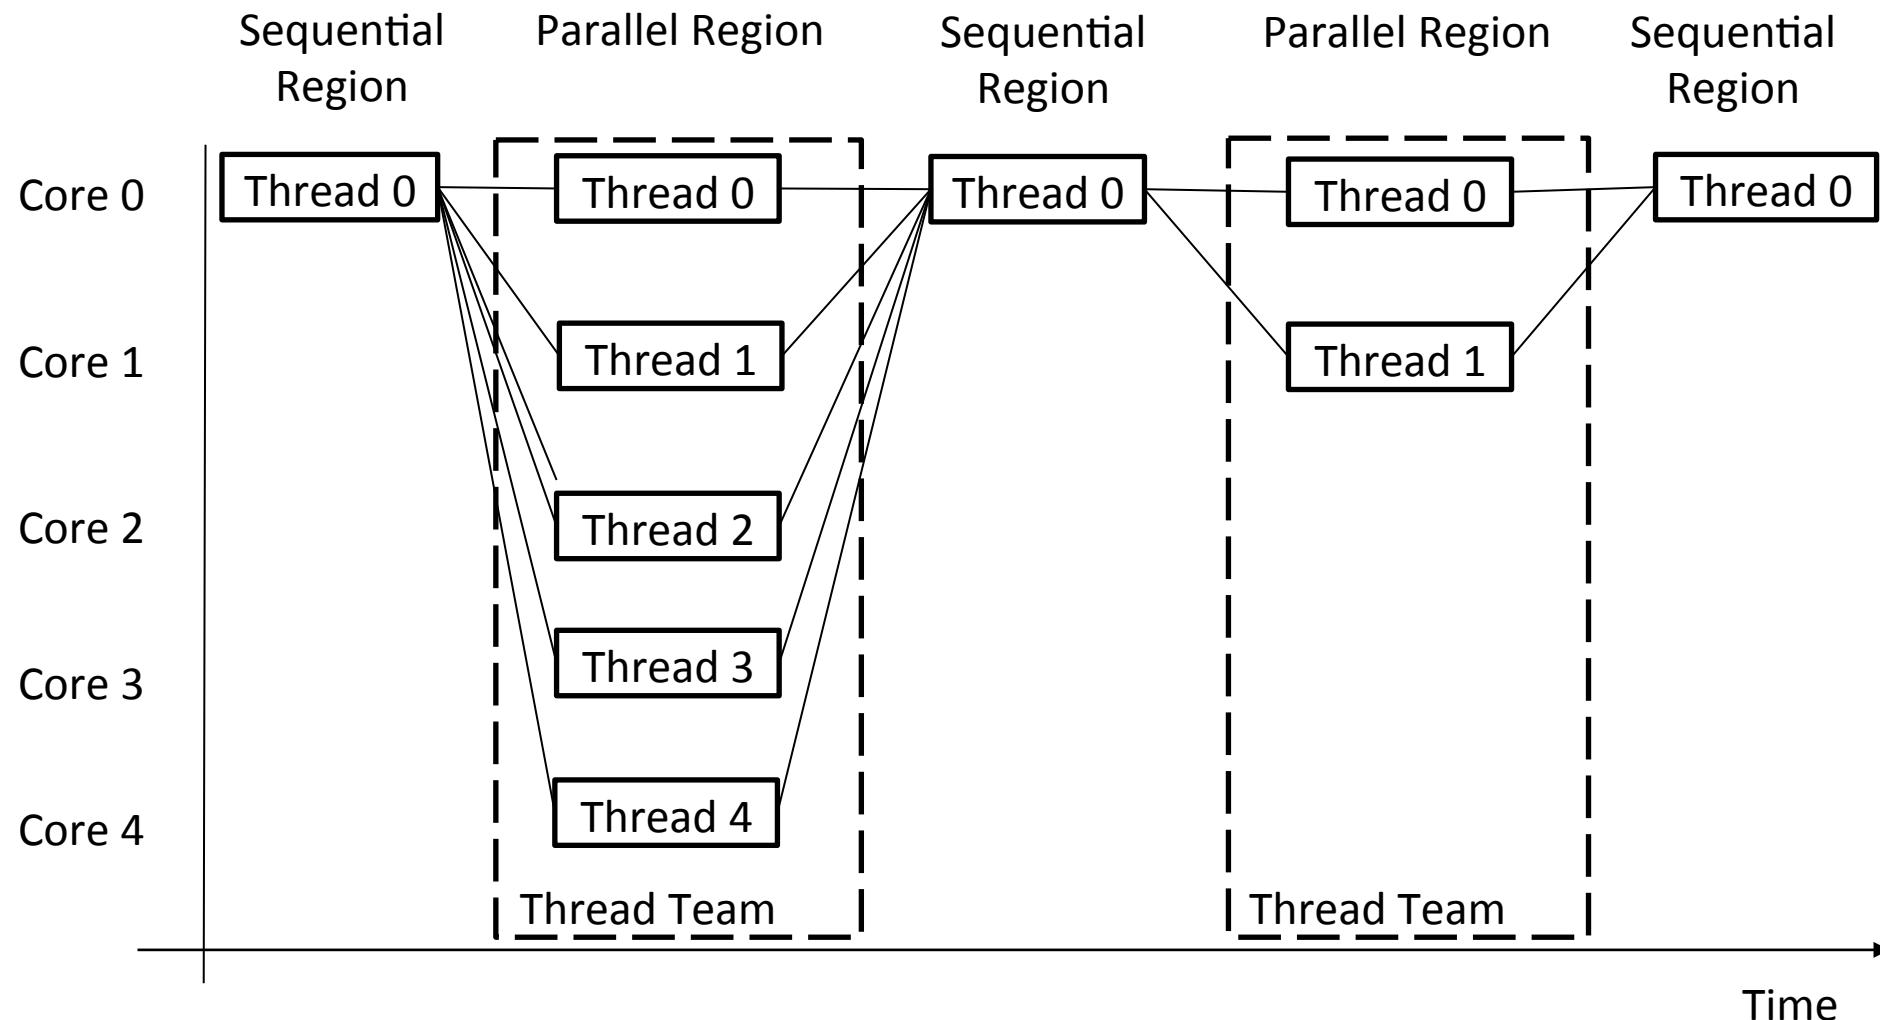

Agenda

- NCC Presentation
- Parallel Architectures
- Intel Xeon and Intel Xeon Phi
- OpenMP
- Thread Affinity
- Vectorization
- Offloading
- Thread League
- N-body Simulation

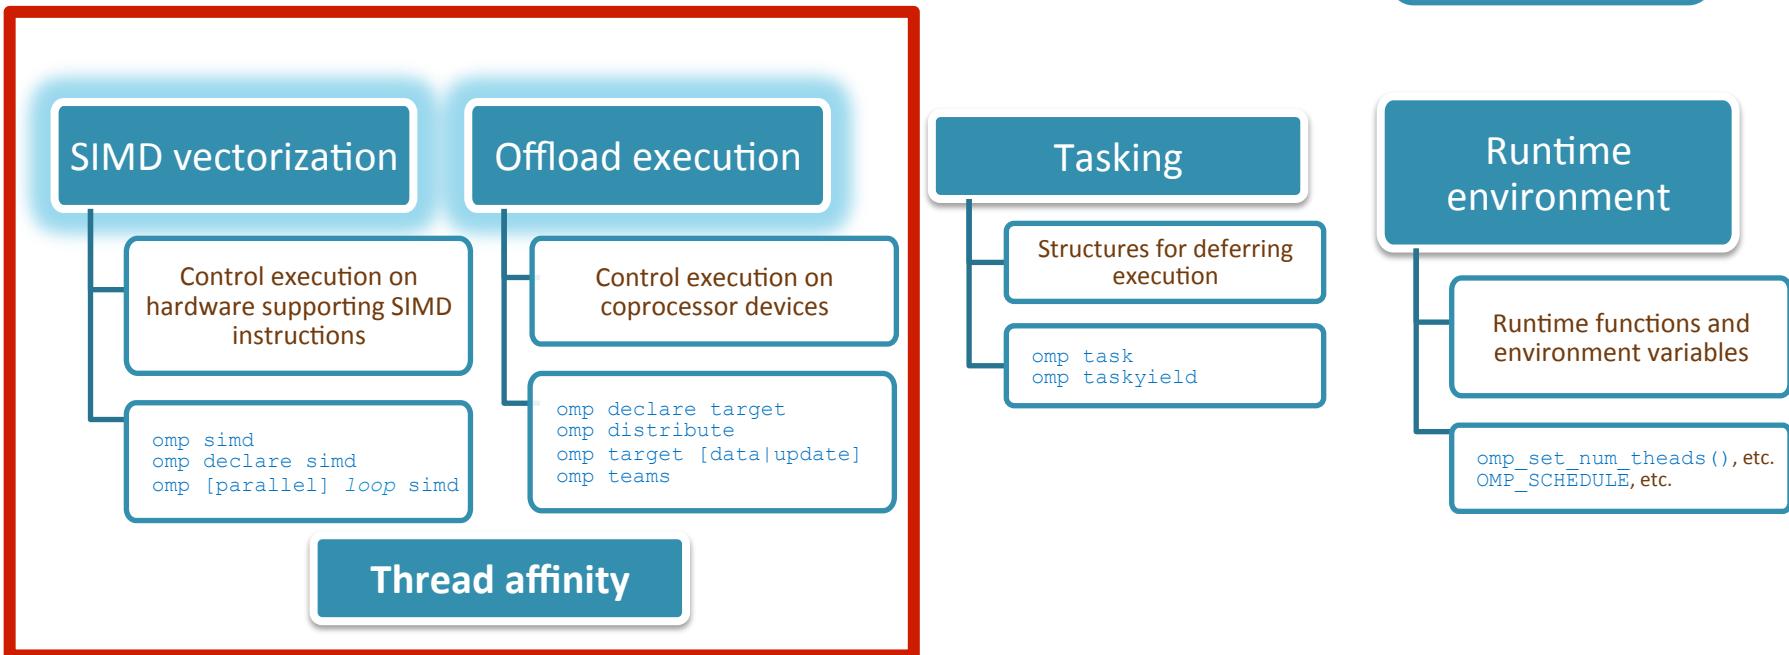

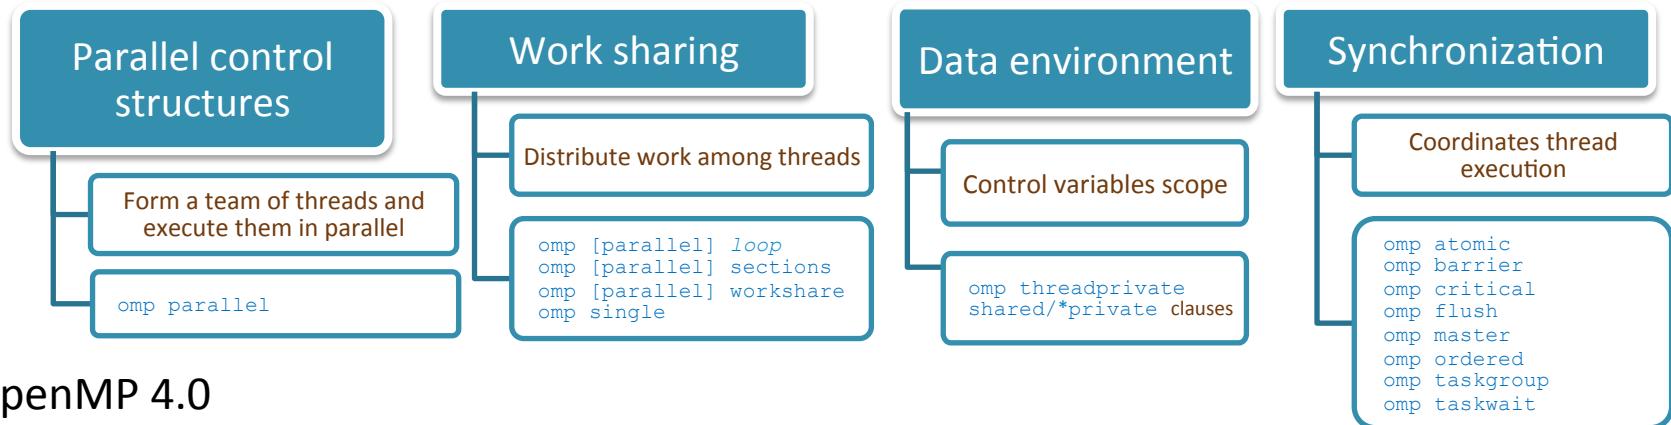

OpenMP

- OpenMP is an acronym for Open Multi-Processing
- An Application Programming Interface (API) for developing parallel programs in shared memory architectures
- Three primary components of the API are:
 - Compiler Directives
 - Runtime Library Routines
 - Environment Variables
- De facto standard - specified for C / C++ and FORTRAN
- <http://www.openmp.org/>
 - Specification, examples, tutorials and documentation

OpenMP

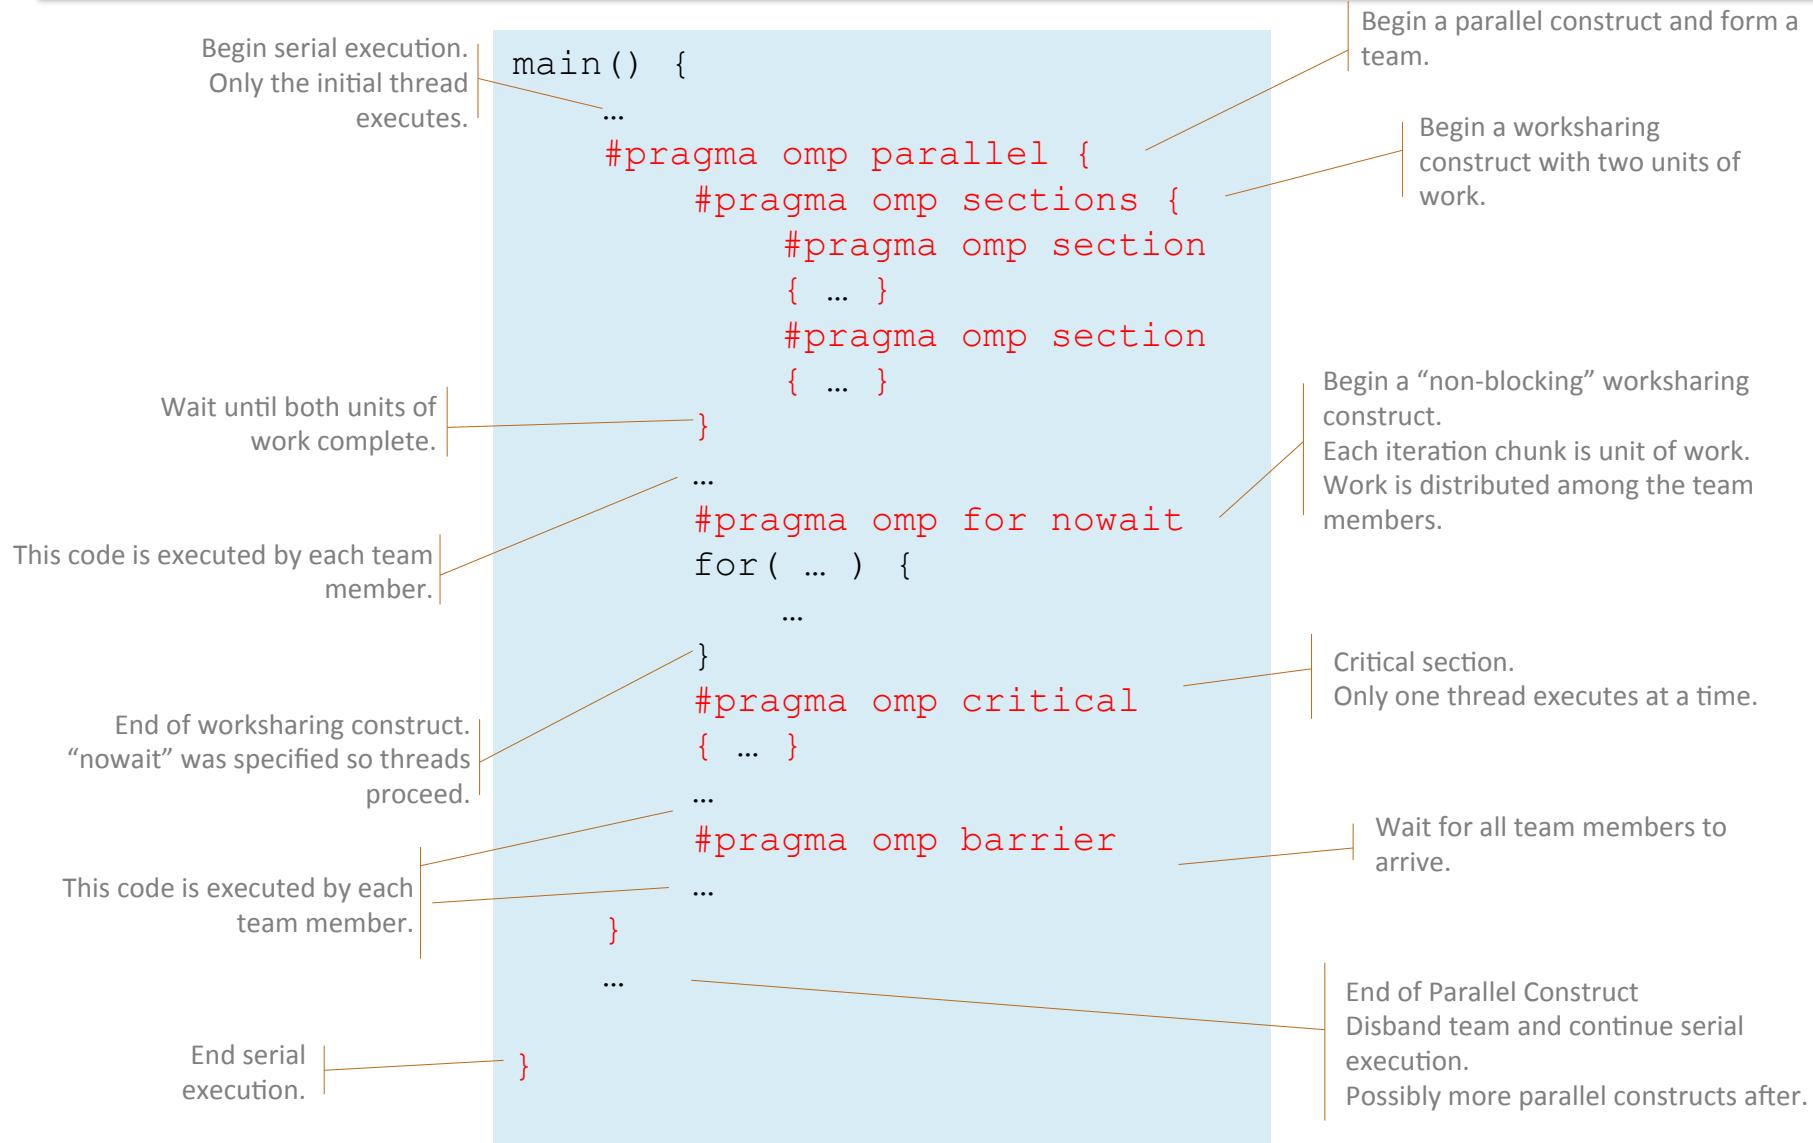

OpenMP - Core elements

OpenMP - Release Notes

- OpenMP 4.0
 - Support for accelerators
 - SIMD constructs to vectorize both serial as well as parallelized loops
 - Thread affinity
- OpenMP 4.5
 - Improved support for devices
 - Thread affinity support
 - SIMD extensions

OpenMP Parallel Processing Model

OpenMP Sample Program

```
N=25;  
#pragma omp parallel for  
for (i=0; i<N; i++)  
    a[i] = a[i] + b;
```

| | Thread 0 | Thread 1 | Thread 2 | Thread 3 | Thread 4 |
|----|-----------|-----------|----------------|----------------|----------------|
| i= | 0 1 2 3 4 | 5 6 7 8 9 | 10 11 12 13 14 | 15 16 17 18 19 | 20 21 22 23 24 |

OpenMP Sample Program

```
#include <stdio.h>                                res = 0;
#include <stdlib.h>
#include <omp.h>                                     #pragma omp for
#include <unistd.h>                                    for ( i = 0 ; i < 100 ; i++ ) {
                                                        p[i] = i/0.855;
int main() {                                         }
    int thid; char hn[600], i;
    double res, p[100];
# pragma omp parallel                         #pragma omp for
{                                              for ( i = 0 ; i < 100 ; i++ ) {
    gethostname(hn,600);
    printf("hostname %s\n",hn);             res = res + p[i];
}                                              }
                                                printf("sum: %f", res);
}                                              }
```

Compiling and running an OpenMP application

```
#Build the application for Multicore Architecture (Xeon)
icc <source-code> -o <omp_binary> -fopenmp
```

```
#Build the application for the ManyCore Architecture (Xeon
Phi)
icc <source-code> -o <omp_binary>.mic -fopenmp -mmic
```

```
#Launch the application on host
./omp_binary
```

```
#Launch the application on the device from host
micnativeunloadex ./omp_binary.mic -e "LD_LIBRARY_PATH=/opt/intel/lib/mic/"
```

Compiling and running an OpenMP application

```
export OMP_NUM_THREADS=10  
.OMP-hello
```

hello from hostname phi02.ncc.unesp.br
Launch the application on the
Coprocessor from host

```
micnativepreloadex ./OMP-hello.mic -e  
"OMP_NUM_THREADS=10 LD_LIBRARY_PATH=/  
opt/intel/lib/mic/"
```

hello from hostname phi02-mic0.ncc.unesp.br
sum of vector elements: 5789.473684

Agenda

- NCC Presentation
- Parallel Architectures
- Intel Xeon and Intel Xeon Phi
- OpenMP
- Thread Affinity
- Vectorization
- Offloading
- Thread League
- N-body Simulation

Thread Affinity

- Thread affinity:
 - Restricts execution of certain threads to a subset of the physical processing units in a multiprocessor computer;
 - OpenMP runtime library has the ability to bind OpenMP threads to physical processing units.

Thread Affinity - KMP_AFFINITY

- **KMP_AFFINITY:**
 - Environment variable that control the physical processing units that will execute threads of an application
- Syntax:

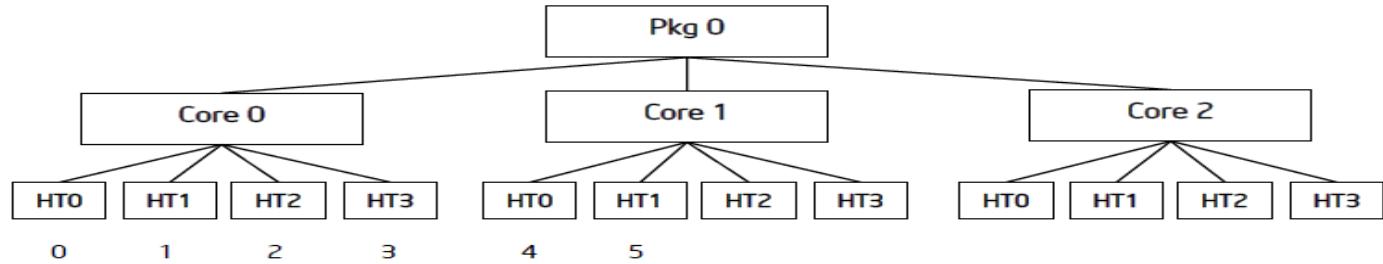

```
KMP_AFFINITY=
  [<modifier>, ...]
  <type>
  [, <permute>]
  [, <offset>]
```

Example:

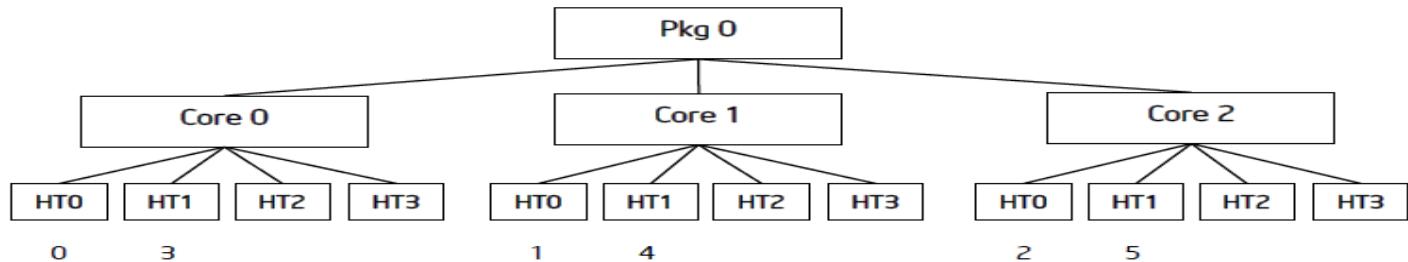

```
export KMP_AFFINITY=scatter
```

KMP_AFFINITY - Types

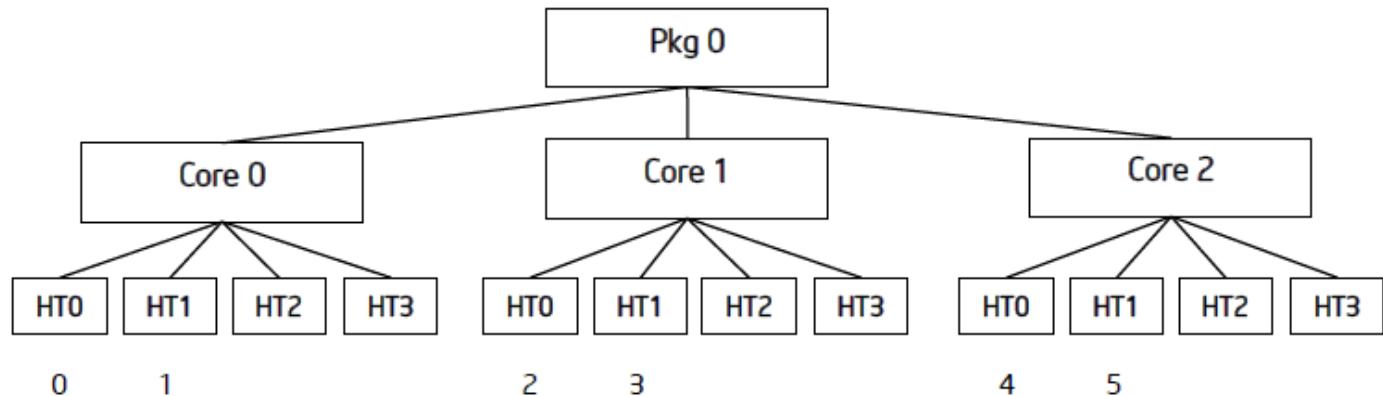

- Compact

- Scatter

- Balanced

Thread Affinity Examples

compact xeon

```
export KMP_AFFINITY=compact,verbose  
./OMP_hello
```

compact xeon phi

```
micnativeloadex ./OMP-hello.mic -e "KMP_AFFINITY=compact,verbose OMP_NUM_THREADS=10 LD_LIBRARY_PATH=/opt/intel/lib/mic/"
```

scatter xeon

```
export KMP_AFFINITY=scatter,verbose  
./OMP_hello
```

scatter xeon phi

```
micnativeloadex ./OMP-hello.mic -e "KMP_AFFINITY=scatter,verbose OMP_NUM_THREADS=10 LD_LIBRARY_PATH=/opt/intel/lib/mic/"
```

balanced xeon phi

```
micnativeloadex ./OMP-hello.mic -e "KMP_AFFINITY=balanced,verbose OMP_NUM_THREADS=10 LD_LIBRARY_PATH=/opt/intel/lib/mic/"
```

Agenda

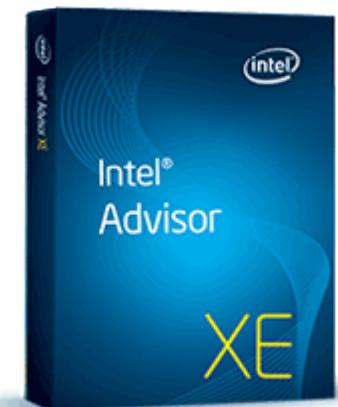

- NCC Presentation
- Parallel Architectures
- Intel Xeon and Intel Xeon Phi
- OpenMP
- Thread Affinity
- Vectorization
- Offloading
- Thread League
- N-body Simulation

Vectorization

- Instructs the compiler to enforce vectorization of loops
(Semi-auto vectorization)
- `omp simd`
 - marks a loop to be vectorized by the compiler
- `omp declare simd`
 - marks a function that can be called from a SIMD loop to be vectorized by the compiler
- `omp parallel for simd`
 - marks a loop for thread work-sharing as well as SIMDing

Intel Advisor

- Evaluate multi-threading parallelization
- Intel® Advisor XE
 - Performance modeling using several frameworks for multi-threading in processors and co-processors:
 - OpenMP, Intel® Cilk™ Plus, Intel® Threading Building Blocks
 - C, C++, Fortran (OpenMP only) and C# (Microsoft TPL)
 - Identify parallel opportunities
 - Detailed information about vectorization;
 - Check loop dependencies;
 - Scalability prediction: amount of threads/performance gains
 - Correctness (deadlocks, race condition)

Intel Advisor

The screenshot shows the Intel Advisor XE 2016 interface. At the top, there's a toolbar with various icons and a menu bar with File, View, Help. Below the toolbar, a navigation bar has "Welcome" selected and shows a project named "e000". The main area is titled "VECTORIZATION WORKFLOW". It contains several sections:

- 1. Survey Target**: Explains where to add efficient vectorization and/or threading. It includes a "Collect" button, a "Command Line" link, and a "No Data" message: "To collect data about your application's performance, compile your application with Release build settings and run [Survey](#) analysis." There's also a "Survey Report" tab.
- 1.1 Find Trip Counts**: Explains how many iterations are executed. It includes a "Collect" button and a "Command Line" link.
- 2.1 Check Dependencies**: Explains identifying and exploring loop-carried dependencies. It includes a "Collect" button, a "Command Line" link, and a message: "Nothing to analyze --".
- 2.2 Check Memory Access Patterns**: Explains identifying complex memory accesses. It includes a "Collect" button, a "Command Line" link, and a message: "Nothing to analyze --".
- A "Switch between Vectorization and Threading workflows" link at the bottom left.
- A "Threading Workflow" button at the bottom left.

The top right corner of the main window displays "Intel Advisor XE 2016".

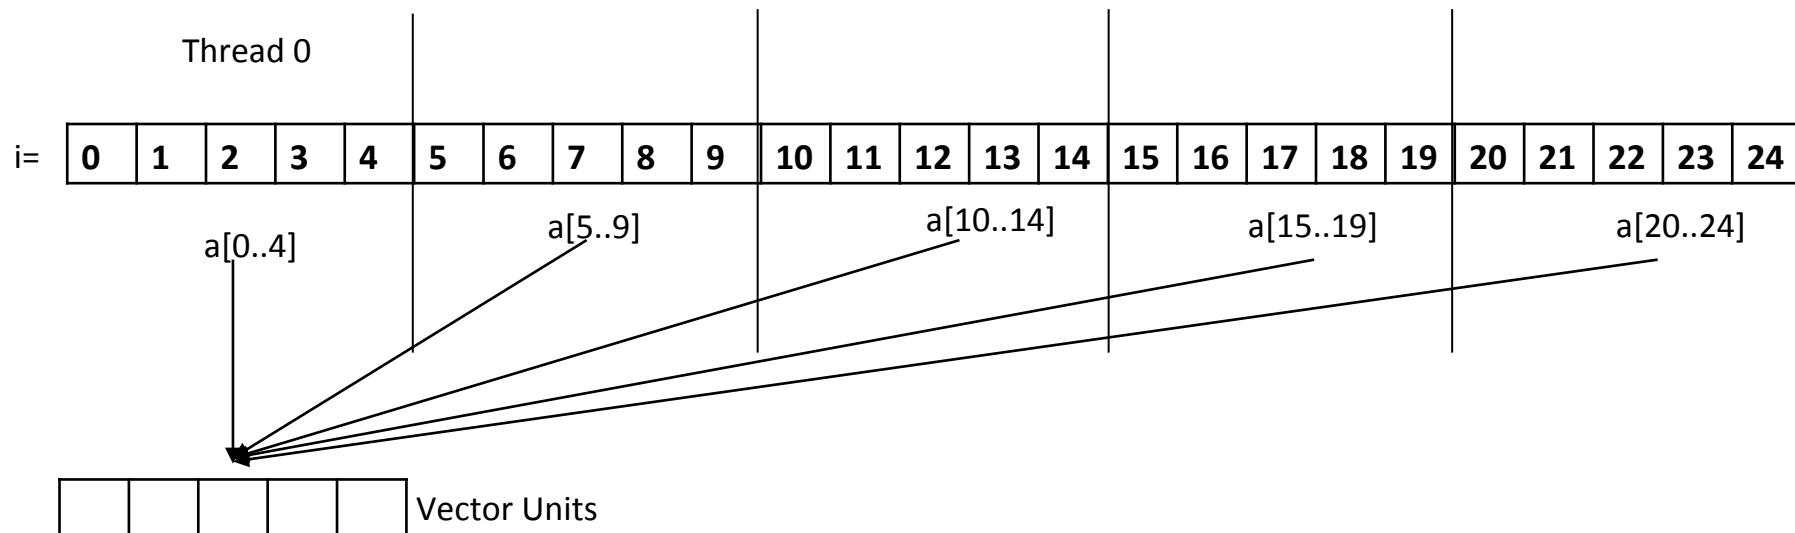

Pragma omp simd

- Vectorize a loop nest
 - Cut loop into chunks that fit a SIMD vector register
 - No parallelization of the loop body

- Syntax

```
#pragma omp simd [clause[,] clause],...]  
for-loops
```

```
N=25;  
#pragma omp SIMD  
for (i=0; i<N; i++)  
    a[i] = a[i] + b;
```

Data Sharing Clauses

- Specifies that each thread has its own instance of a variable:
 - `private(var-list)`: uninitialized vectors for variables in *var-list*
 - `firstprivate(var-list)`: Initialized vectors for variables in *var-list*
 - `lastprivate(var-list)`:
 - similar to `private` clause
 - Private copy of last iteration is copied to the original variable
 - `reduction(op:var-list)`: create private variables for *var-list* and apply reduction operator *op* at the end of the construct

SIMD Loop Clauses

- `simdlen (length)`
 - generate function to support a given vector length
- `safelen (length)`
 - Maximum number of iterations that can run concurrently without breaking a dependence
- `linear (list[:linear-step])`
 - The variable's value is in relationship with the iteration number
 $x_i = x_{\text{orig}} + i * \text{linear-step}$
- `aligned (list[:alignment])`
 - Specifies that the list items have a given alignment
 - Default is alignment for the architecture
- `collapse (n)`
 - Groups two or more loops into a single loop

Pragma omp simd - Example 1

```
#pragma omp parallel for collapse (2)
for ( i=0; i <msize ; i++) {
    for ( k=0; k<msize ; k++) {
        #pragma omp simd
        for ( j=0; j<msize ; j++) {
            c[i][j] = c[i][j] + a[i][k] * b[k][j] ;
        }
    }
}
```

OMP SIMD - Vectorization Report

Compiler could not automatically vectorize loop on line 228, because of “assumed dependency”

| Loops | Vector Issues | Self Time | Total Time | Loop Type | Why No Vectorization? |

OMP SIMD - Vectorization Report

#pragma omp simd guided the compiler to vectorize loop using AVX2

Pragma omp simd - Example 2

```
void vec3(float *a, float *b, int off, int len)
{
    int i;
    #pragma omp simd aligned(a:64, b:64) simdlen(64)
    for(i = 0; i < len; i++)
    {
        a[i] = (sin(cos(a[i])) > 2.34) ?
            a[i] * atan(b[i]) :
            a[i] + cos(sin(b[i]));
    }
}
```

OMP SIMD Example 2 - Vectorization Report

Assumed dependency prevents automatic vectorization;

SIMD Function Vectorization

- Declare one or more functions to be compiled for calls from a SIMD-parallel loop
- Syntax (C/C++):

```
#pragma omp declare simd [clause[,] clause],...]
[#pragma omp declare simd [clause[,] clause],...]]
[...]
function-definition-or-declaration
```

SIMD Function Vectorization

- uniform (*argument-list*)
 - argument has a constant value between the iterations of a given loop
- inbranch
 - function always called from inside an if statement
- notinbranch
 - function never called from inside an if statement
- simdlen (*argument-list[:linear-step]*)
- linear (*argument-list[:linear-step]*)
- aligned (*argument-list[:alignment]*)
- reduction (*operator:list*)

Pragma omp declare simd

```
#pragma omp declare simdlen (SIMD_LEN)
```

```
int FindPosition(double x) {  
    return (int)(log(exp(x*steps)));  
}
```

```
#pragma omp declare simd uniform (vals)
```

```
double Interpolate(double x, const point*  
vals)
```

```
{  
    int ind = FindPosition(x);  
    ...
```

```
    return res;
```

```
}
```

```
int main ( int argc , char argv [] )  
{  
    ...  
    for ( i=0; i < ARRAY_SIZE; ++ i ) {  
        dst[i] = Interpolate( src[i], vals ) ;  
    }  
    ...  
}
```

Analysis of function Interpolate

- Without uniform clause ./main 0m36.828s
- Using uniform clause ./main 0m16.926s
- OpenMP parameter uniform enabled the compiler to use the “fused multiply and add” instruction

Pragma omp for simd

- Parallelize and vectorize a loop nest
 - Distribute a loop's iteration space across a thread team
 - Subdivide loop chunks to fit a SIMD vector register

- Syntax

```
#pragma omp for simd [clause[,] clause],...]
for-loops
```

```
N=25;
#pragma omp for simd
for (i=0; i<N; i++)
    a[i] = a[i] + b;
```

Pragma omp for simd

#pragma omp parallel for simd

```
for(i=0; i<msize; i++) {  
    a[i][j] = distsq(a[i][j], b[i][j])-auxrand;  
    b[i][j] += min(a[i][j], b[i][j])+auxrand;  
    c[i][j] = (min(distsq(a[i][j], b[i][j]), a[i][j]))/auxrand;  
}
```

Agenda

- Thread Affinity
- Vectorization
- Offloading
- Thread League
- N-body Simulation

OpenMP 4.0 Offload

- **target:** transfers the control flow to the target device
 - Transfer is sequential and synchronous
 - Transfer clauses control data flow
- **target data:** creates a scoped device data environment
 - Does not include a transfer of control
 - Transfer clauses control data flow
 - The device data environment is valid through the lifetime of the target data region
- **target update:** request data transfers from within a target data region
- **omp declare target:** creates a structured-block of functions that can be offloaded.

OpenMP 4.0 Offload Report

- OFFLOAD REPORT:
 - Measures the amount of time it takes to execute an offload region of code;
 - Measures the amount of data transferred during the execution of the offload region;
 - Turn on the report: `export OFFLOAD_REPORT=2`
- **[Var]** The name of a variable transferred and the direction(s) of transfer.
- **[CPU Time]** The total time measured for that offload directive on the host.
- **[MIC Time]** The total time measured for executing the offload on the target.
- **[CPU->MIC Data]** The number of bytes of data transferred from the host to the target.
- **[MIC->CPU Data]** The number of bytes of data transferred from the target to the host.

Pragma omp declare target

- Creates a structured-block of functions that can be offloaded.
- Syntax
 - `#pragma omp declare target [clause[,] clause],...`
declaration of functions
 - `#pragma omp end declare target`

Pragma omp target

- Transfer control [and data] from host to device
- Syntax
 - `#pragma omp target [data] [clause[,] clause],...`
structured-block
- Clauses
 - `device(scalar-integer-expression) :`
 - `device to offload code;`
 - `map(alloc | to | from | tofrom: list) :`
 - `map variables to device;`
 - `if(scalar-expr) :`
 - `test an expression before offload:`
 - True executes on device;
 - False executes on host;
 - `Nowait`
 - Execute the data transfer defined in map asynchronously;

Pragma omp target

- Map clauses:
 - alloc : allocate memory on device;
 - to : transfer a variable from host to device;
 - from : transfer a variable from device to host;
 - tofrom :
 - transfer a variable from host to device before start execution;
 - transfer a variable from device to host after finish execution;

Offloading - omp target

```
Int main() {  
    Printf("begin");  
    int N=25;  
    int b =2;  
    int l = 0;
```

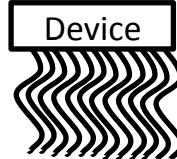

*Offload:
Copy variable:
N,b,l and a to device*

```
#pragma omp target map(N,b,l,a)  
{  
    for (i=0; i<N; i++) a[i] = 2;  
    for (i=0; i<N; i++) a[i] = a[i] + b;  
}
```

```
for (i=0; i<N; i++)  
    printf("%d",a[i]);  
...  
return(0);  
}
```

Host

synchronization

- ↗ Thread
- ↓ Host execution
- ↓ Device execution
- Data transfer between host and device

Time

Pragma omp target example

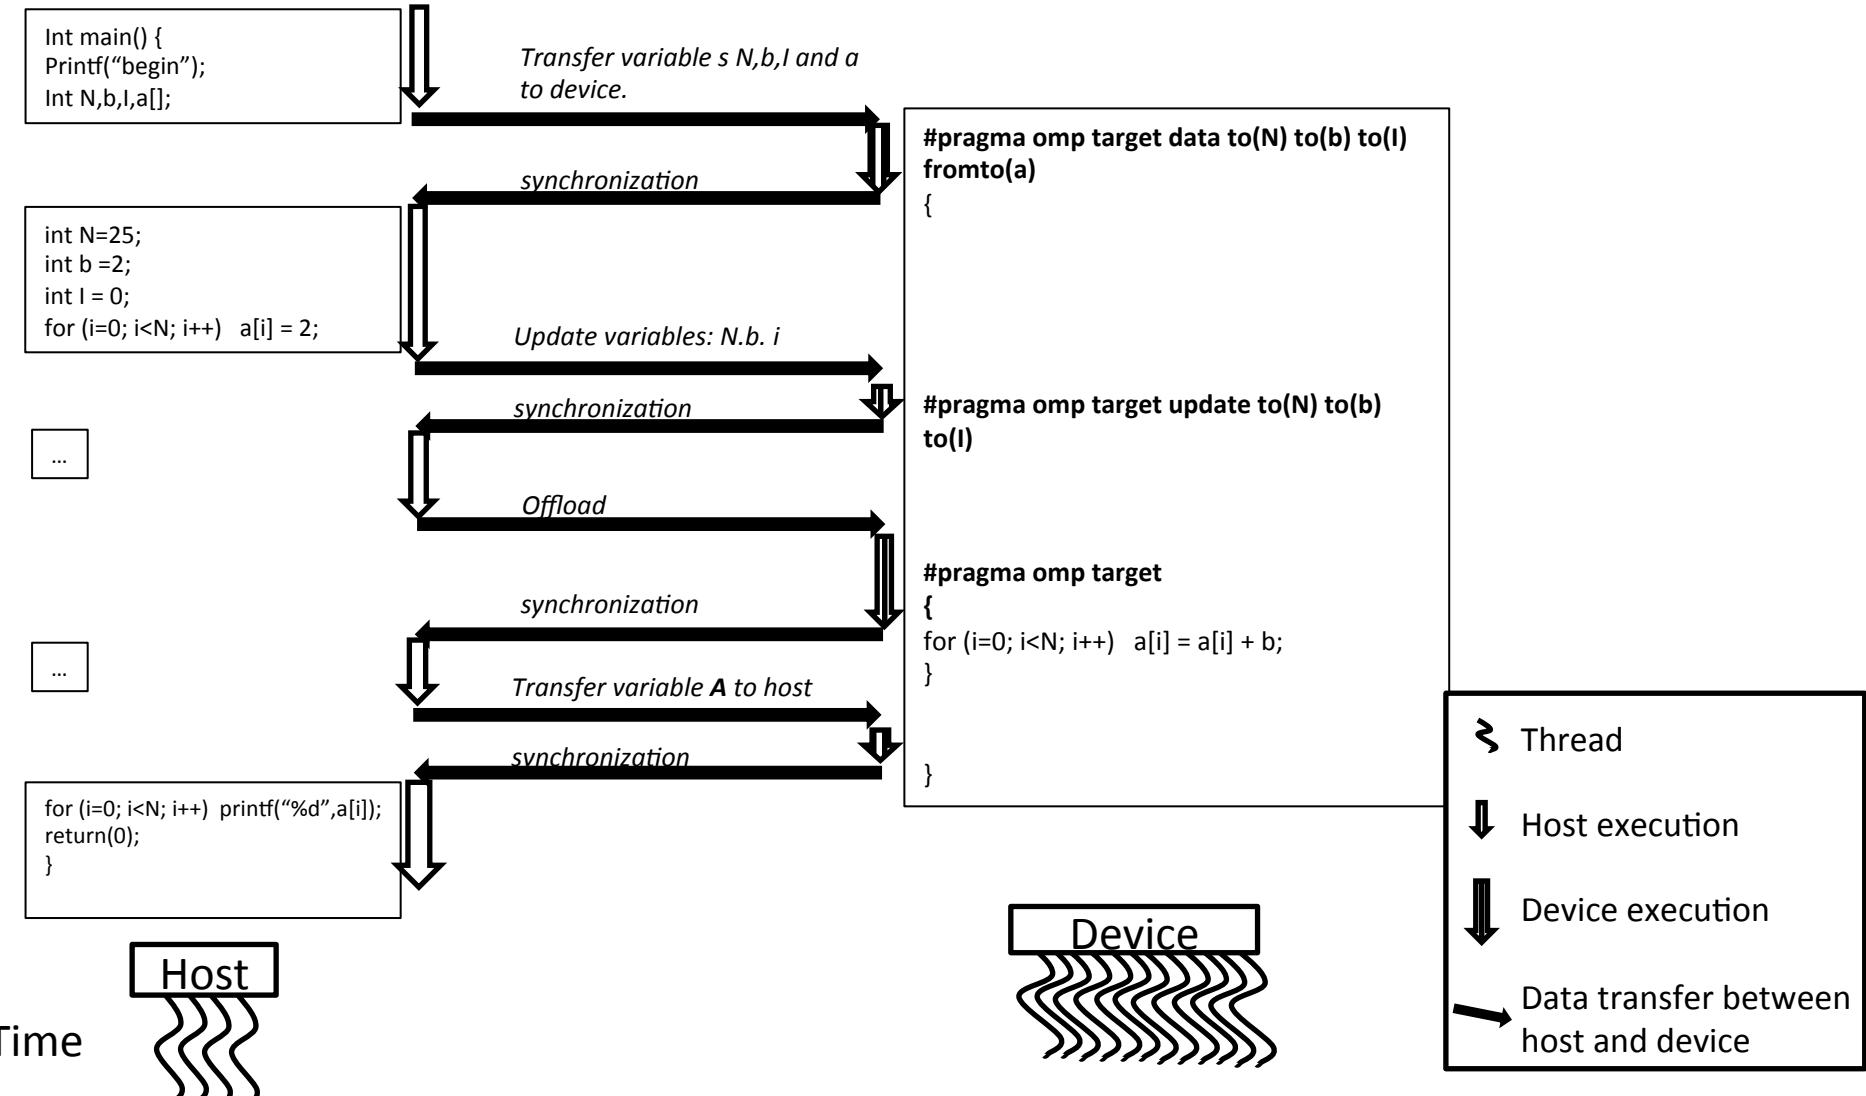

```
#pragma omp target device(0) map(a[0:NUM][0:NUM])
map(b[0:NUM][0:NUM]) map(c[0:NUM][0:NUM])
{
    #pragma omp parallel for collapse (2)
    for(i=0; i<msize; i++) {
        for(k=0; k<msize; k++) {
            #pragma omp simd
            for(j=0; j<msize; j++) {
                c[i][j] = c[i][j] + a[i][k] * b[k][j];
            }
        }
    }
}
```

Pragma omp target example

- Offloading
- Thread League
- N-body Simulation

Thread League

- **omp teams:** creates a league of thread teams
 - `#pragma omp teams [clause [[,] clause] . . .]`
 - ❑ `num_teams(amount)` : define the amount of thread teams
 - ❑ `thread_limit(limit)` : define the highest amount of threads that can be created in each team;
- **omp distribute:** distributes a loop over the teams in the league
 - `#pragma omp distribute [clause [[,] clause] . . .]`
 - ❑ `dist_schedule (static[block size])`:

Thread League

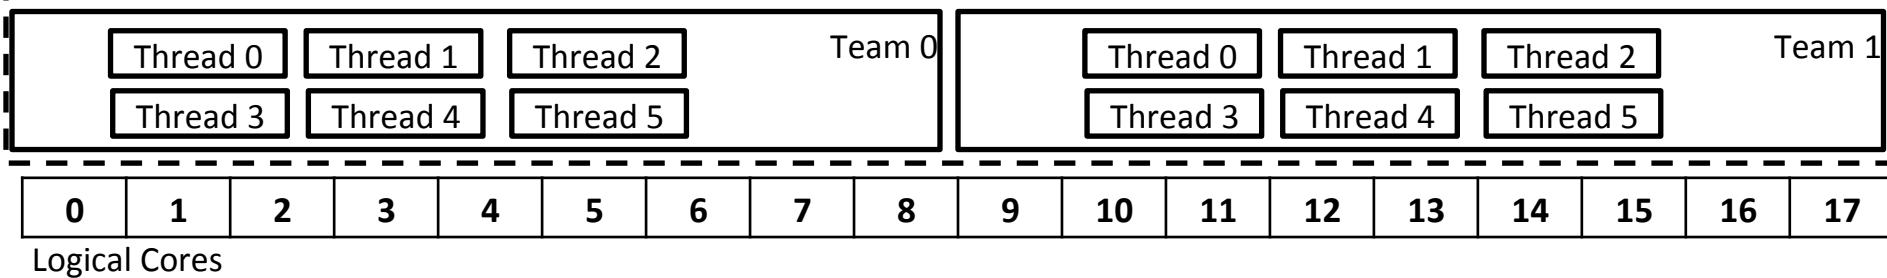

```
#pragma omp target teams num_teams (2) thread_limit (6)
{
    int i , N, teams , idteam , idthread ; int sum; N=20;
    #pragma omp distribute parallel for reduction (+:sum)
    for ( i =0; i <N; i ++) sum += i ;
}
```

Example1

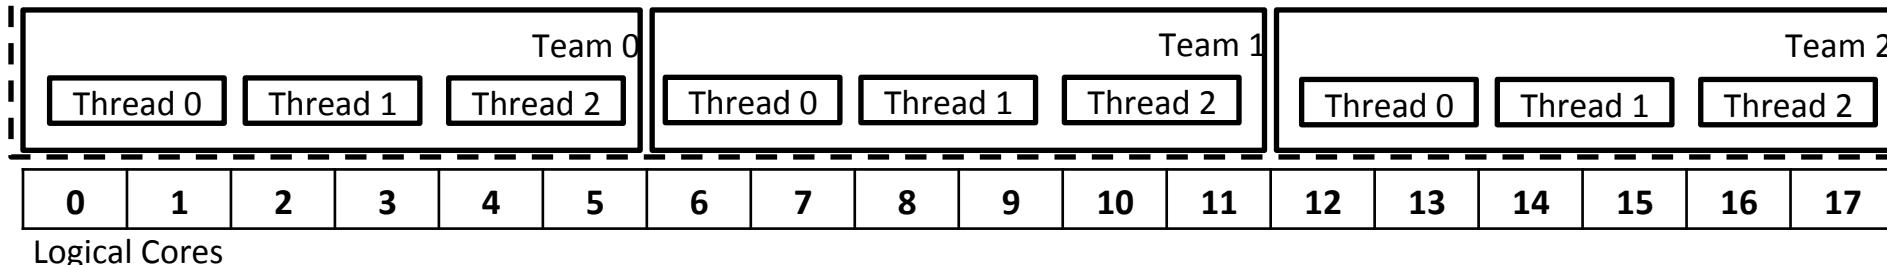

```
#pragma omp target teams num_teams (3) thread_limit (3)
{
    int i , N, teams , idteam , idthread ; int sum; N=20;
    #pragma omp distribute parallel for reduction (+:sum)
    for ( i =0; i <N; i ++) sum += i ;
}
```

Example2

Thread League– Example 1

Thread League– Example 2

Thread League - Example 1

```
#pragma omp target teams num_teams (2) thread_limit( 3 )
{
    int i, N, teams, idteam , idthread;
    int sum;
    N=20;

#pragma omp distribute parallel for reduction (+: sum)
for ( i =0; i <N; i ++) {
    sum += i ;
    idthread = omp_get_thread_num ();
    idteam = omp_get_team_num () ;
    teams = omp_get_num_teams () ;
    printf("i %d n %d idteam %d idthread %d teams %d \n" , i ,N, idteam ,
idthread , teams ) ;
}
}
```

Thread League - Example 2

```
#pragma omp target data device (0) map (i , j , k) map ( to : a[0:NUM]
[0:NUM] ) map ( to : b [ 0 :NUM] [ 0 :NUM] ) map ( tofrom : c [ 0 :NUM]
[ 0 :NUM] )
{
    #pragma omp target teams distribute parallel for collapse (2)
num_teams (2) thread_limit (30)
    for ( i =0; i <NUM; i ++) {
        for ( k =0; k<NUM; k++) {
            #pragma omp simd

- N-body Simulation

N-Body Simulation

- An N-body simulation [1] aims to approximate the motion of particles that interact with each other according to some physical force;
- Used to study the movement of bodies such as satellites, planets, stars, galaxies, etc., which interact with each other according to the gravitational force;
- Newton's second law of motion can be used in a N-body simulation to define the bodies' movement.

[1] AARSETH, S. J. *Gravitational n-body simulations*. [S.I.]: Cambridge University Press, 2003. Cambridge Books Online.

N-Body Algorithm

- Bodies struct:
 - 3 matrix represents velocity (x,y and z)
 - 3 matrix represents position (x,y and z)
 - 1 matrix represent mass
- A loop calculate temporal steps:
 - At each temporal step new velocity and position are calculated to all bodies according to a function that implements Newton's second law of motion

N-Body - Parallel version (host only)

```
function Newton(step)
{
    #pragma omp for
    for each body[x] {
        #pragma omp simd
        for each body[y]
            calc force exerted from body[y] to body[x];
            calc new velocity of body[x]
    }
    #pragma omp simd
    for each body[x]
        calc new position of body[x]
}

Main() {
    for each temporal step
        Newton(step)
}
```

N-Body - Parallel version (Load balancing)

- The temporal step loop remains sequential
- The N-bodies are divided among host and devices to be executed using Newton
- OpenMP offload pragmas are used to
 - Newton function offloading to devices
 - Transfer data (bodies) between host and devices

N-Body - Parallel version (Load balancing)

```
function Newton(step, begin_body, end_body, devicId)
{
    #pragma omp target device (devicId) {
        #pragma omp for
        for each body[x] from subset(begin_body, end_body) {
            #pragma omp simd
            for each body[y] from subset(begin_body, end_body)
                calc force exerted from body[y] to body[x];
            calc new velocity of body[x]
        }
        #pragma omp simd
        for each body[x]
            calc new position of body[x]
    }
}
```

N-Body - Parallel version (Load balancing)

for each temporal step

Divide the amount of bodies among host and devices;

```
#pragma omp parallel
```

```
{
```

```
    #pragma omp target data device ( tid ) to(bodies[begin_body:  
end_body])
```

```
{
```

```
    Newton(step, begin_body, end_body, deviceId)
```

```
    #pragma omp target update device ( tid ) (from:bodies)
```

```
    #pragma omp barrier
```

```
    #pragma omp target data device ( tid )  
to(bodies[begin_body: end_body])
```

```
}
```

```
}
```

Thank you for your attention
(Obrigado!)
